The sun rises in the east every day, casting long shadows that gradually decrease in size as it moves overhead. This consistent pattern suggests a natural cycle of Earth's rotation, creating day and night. Such evidence supports the idea that the Earth rotates on its axis.

The Earth's rotation on its axis is a well-established scientific fact. As evidence, the sun consistently rises in the east every day, creating a cycle of day and night. The gradual decrease in shadow size as the sun moves overhead further supports this phenomenon, confirming the Earth's rotation.

In a series of laboratory trials, researchers consistently found that plants exposed to higher levels of carbon dioxide exhibited faster rates of growth compared to those grown in normal atmospheric conditions. These repeated experimental outcomes suggest a causal relationship between increased carbon dioxide levels and enhanced plant growth.

Higher levels of carbon dioxide have been repeatedly shown to lead to faster plant growth in controlled laboratory experiments. This consistent outcome indicates a direct cause-and-effect relationship between increased carbon dioxide levels and enhanced plant growth.
